

## The anchor element - understanding HTML attributes

### Keywords/Questions:

### Notes:

anchor elements looks like:

```
<a>This is a link </a>
```

```
<a href="https://www.google.com">link </a>
```

here "href" is an attribute, we can add some other attributes too.

The HTML element "<a>" or (anchor element) with its href attribute creates a hyperlink to web pages, files, email addresses, locations in the same page, or everything else a URL can address.

content within each "<a>" should indicate the link's destination. If the "href" attribute is present, pressing the enter key will be focussed on the <a> element will activate it.

Try attribute "draggable = True".

### Summary:

=> anchor element - creating links.
